

# Seed Portability Micro Study

## Abstract

This local PDF evaluates whether Solar can synthesize a report from a non-web seed. The document is intentionally small but contains extractable body text and section labels.

## Methods

Our method uses a controlled local PDF ingestion task with a bounded parser and no network access. We compare the extracted text against expected title, method, result, and limitation statements.

## Results

The result shows local PDF seeds preserved the source title and method text in the report. The result found 17 validated records in the synthetic portability checklist.

## Limitations

The limitation is that this micro study uses one small local PDF and a deterministic parser only. It does not claim performance for scanned image PDFs or encrypted documents.
